Dear Avira Betatester,

Welcome to the official Beta test of the Avira Userland QA.

Please make sure you follow the steps below to configure your Avira Product for the Betatest

Download the newest beta license from the download section of the BetaCenter.

Save the license to your local hard drive disk.

Before you're going to install the beta license, Make sure you have a backup of the old hbedv.key from the folder C:\Program Files (x86)\Avira\AntiVir Desktop\

Now you have 3 possible ways to install the beta license.

### A: Direct installation

Open the folder where you saved the beta license and just double click on the hbedv.key

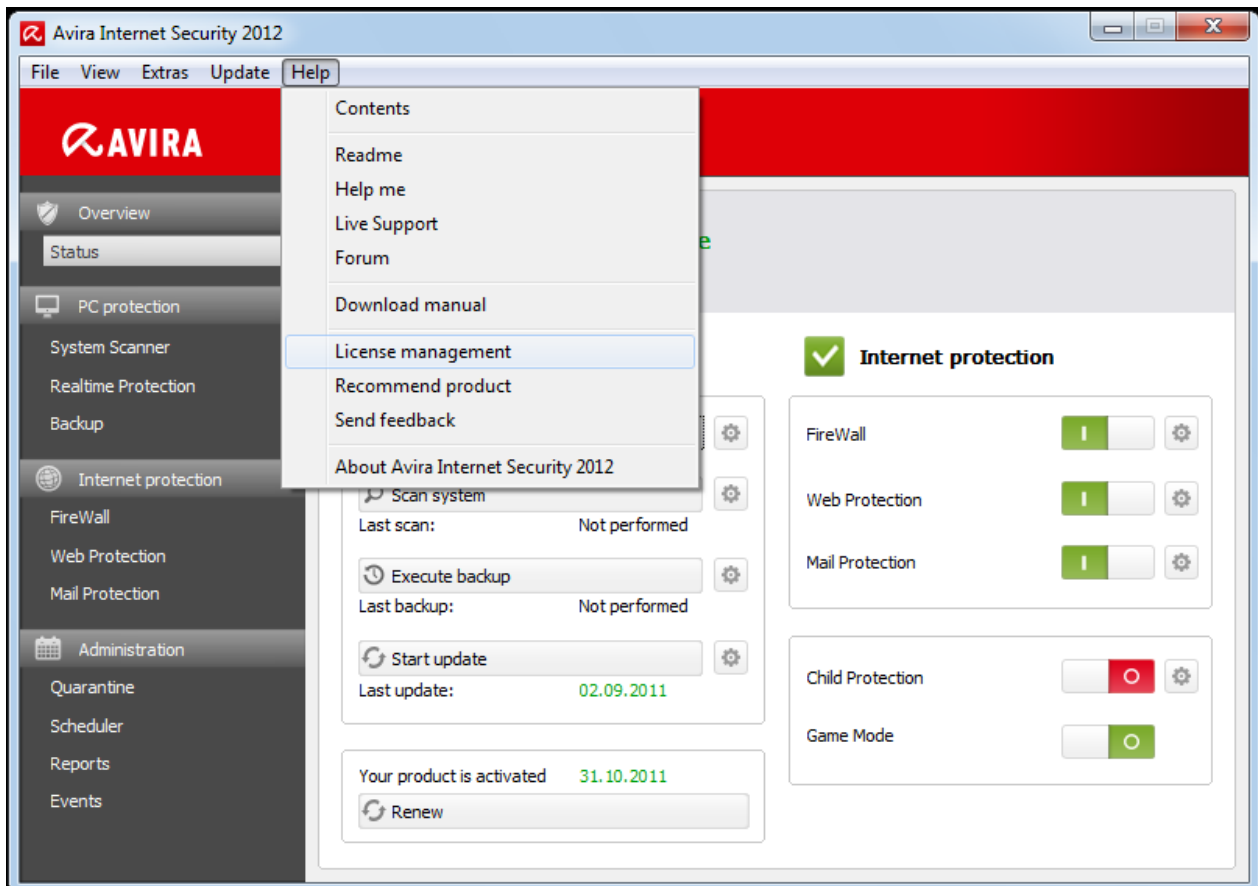

Confirm with „OK“ and the next window with „yes“

Afterwards you will get a notification that you just updated your license.

## B: Installation with the license manager

Open the Avira Control Center and choose Help -> License manager from the menu.

At the license manager, choose „I already have a valid hbedv.key License file.“

Browse now to the beta license hbedv.key file you saved in the first step and confirm with “OK”

## **C: Manual installation to the Avira directory**

Before you're able to manual replace the hbedv.key file at the avira directory you have to disable the „Product Protection“.

Right click the tray icon and select “Configure Avira [Product name]”

Go to General -> Security and uncheck the checkbox at “Protect files and registry entries from manipulation.

Copy now the beta license hbedv.key to C:\Programm files(x86)\Avira\AntiVir Desktop

Afterwards you have to restart the AntiVir Guard Service or do a reboot.

Don't forget to turn on your product protection when everything is done.

## **Update to the newest BetaVersion:**

When you went through one of the 3 possible ways to install the beta license you can update your Product via Product Update (Select Update -> Product update from the Menu).
